module-16: working with forms & user input

module-16_3 starts here,, tutorial: 11-14

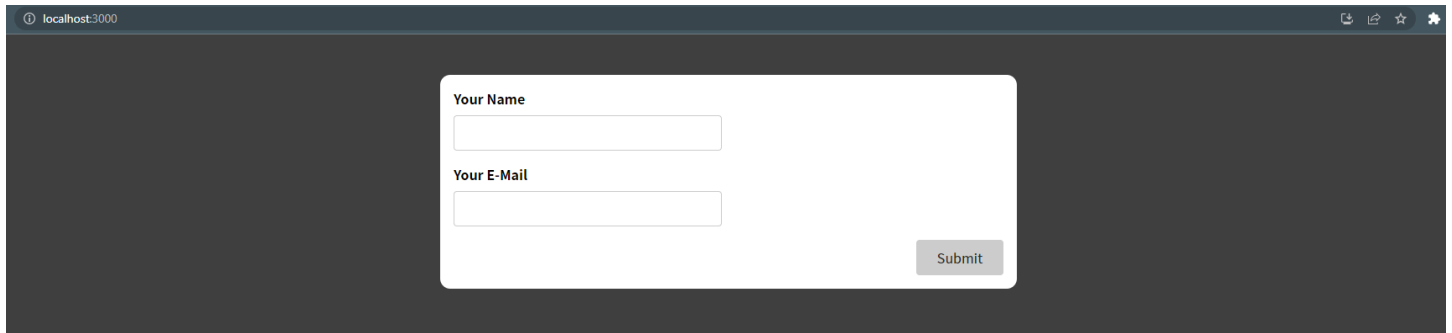

Here, input element is managed by custom hook.

In input element,

ref deals with the current value of an input field

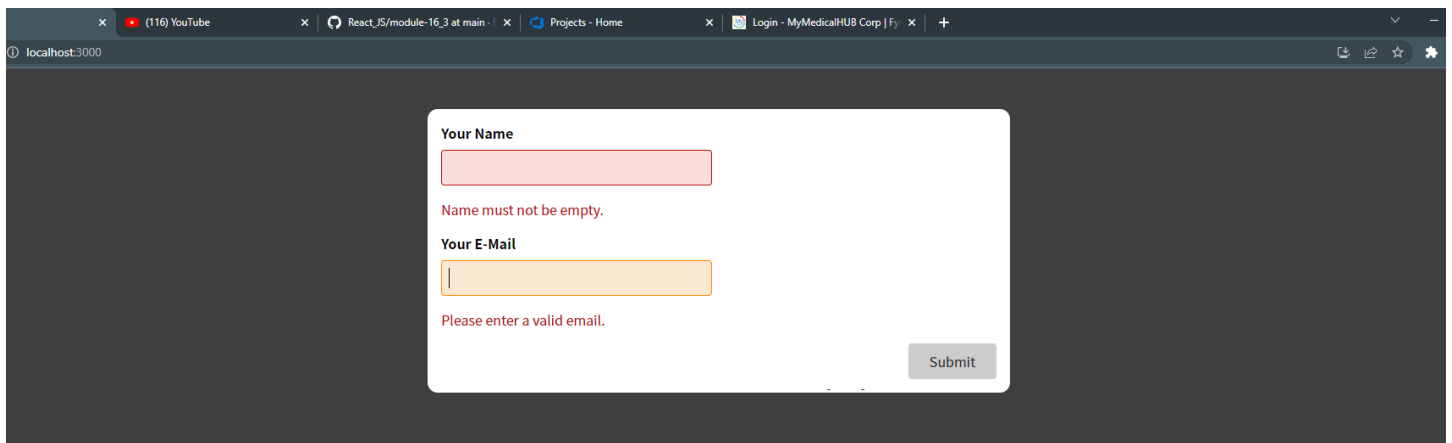

onchange deals with every keystroke in an input field

here, in the form, email is handled by useState & name is handled by custom hook.

The screenshot shows a web browser window at localhost:3000. The page has a dark background. In the center, there is a white rounded rectangle containing a form. The form has two input fields: 'Your Name' and 'Your E-Mail'. The 'Your Name' field is empty. The 'Your E-Mail' field is also empty. To the right of the input fields is a grey 'Submit' button.

⇒ Initial form

The screenshot shows the same web browser window at localhost:3000, but now the form is invalid. The 'Your Name' input field is highlighted with a red border and a red error message 'Name must not be empty.' below it. The 'Your E-Mail' input field is highlighted with an orange border and an orange error message 'Please enter a valid email.' below it. The 'Submit' button remains grey.

⇒ When form input is invalid
